

FIG. 1A

A vitamin D component added to the assay system to compete with the released vitamin D component.

A vitamin D component released by the releasing composition.

A vitamin D binding protein, for example DBP.

A solid phase, for example, a magnetic particle.

A host component, for example an antibody, which recognizes a vitamin D component.

A molecule which can bind to a biotin, for example streptavidin or avidin.

A label, for example acridinium.

A biotin.

A protein, for example an antibody, capable of binding to a vitamin D component at a site other than the one that is recognized by a host component.

Means that one entity is linked to another entity. The linkage may be direct, or through another molecule or molecules.

Means that one entity is linked to another entity. The linkage may be direct, or through another molecule or molecules.
